

Netfira Workflows

Automation that meets your needs

We recognise that each business has unique operational needs and processes. Rather than forcing businesses to conform to a standard software process, Netfira Workflows empower companies to tailor the platform to fit their specific requirements. This level of customisation sets us apart from other automation and IDP solutions, providing businesses with the flexibility and control they need.

Infinite Customisation

Netfira Workflows offer limitless possibilities for document processing, allowing businesses to configure workflows precisely to their needs. Unlike other solutions that merely extract and export data, our platform processes information intelligently, ensuring it aligns with their operational goals and requirements.

Enhanced Flexibility

With this flexibility, businesses can tailor processes to specific document types and scenarios. This adaptability ensures that workflows can evolve as business needs change, providing ongoing efficiency and optimisation.

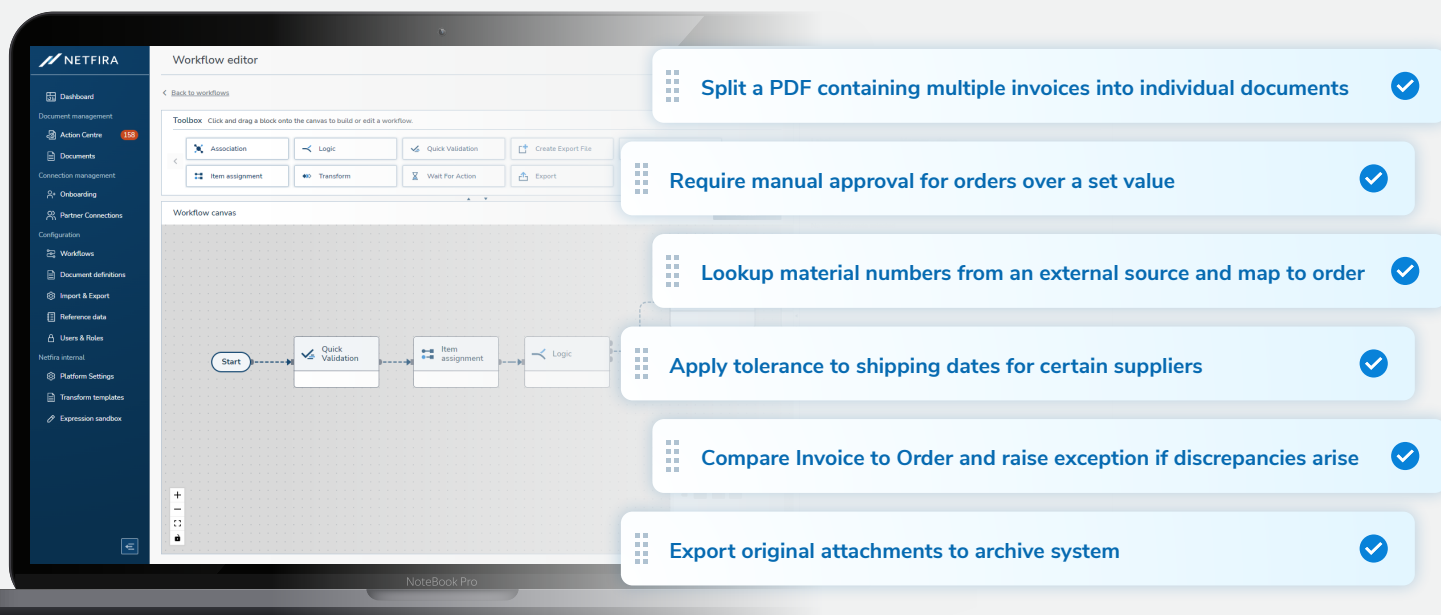

Seamless Integration

Our solution integrates seamlessly with existing systems and processes, providing a cohesive experience across all platforms. This seamless integration ensures that businesses can leverage the full capabilities of our platform without disrupting established workflows. Whether it's connecting with ERP systems, external databases, or other software solutions, our workflows ensure a smooth, uninterrupted flow of information, allowing operations to run efficiently and effectively.

Customisation Within Workflows

Netfira's workflows offer businesses full transparency and control over their automation processes. Companies can customise every aspect, from notifications and exception handling to human intervention points. For example, they can set specific rules, such as requiring manual approval for purchase orders exceeding \$10,000 or integrating external data to accurately match material numbers. This extensive customisation ensures that document processing is not only efficient but also perfectly aligned with their business's unique requirements.

Split a PDF containing multiple invoices into individual documents ✓

Require manual approval for orders over a set value ✓

Lookup material numbers from an external source and map to order ✓

Apply tolerance to shipping dates for certain suppliers ✓

Compare Invoice to Order and raise exception if discrepancies arise ✓

Export original attachments to archive system ✓
